2024 Kilbaha VCE Mathematical Methods Trial Examination 1 Detailed answers

Question 1

a.

$$f(x) = \log_{e}\left(\sqrt{(x^{3}+1)}\right) = \log_{e}\left(\left(x^{3}+1\right)^{\frac{1}{2}}\right) = \frac{1}{2}\log_{e}\left(x^{3}+1\right)$$
$$f'(x) = \frac{1}{2}\frac{\frac{d}{dx}(x^{3}+1)}{(x^{3}+1)} = \frac{3x^{2}}{2(x^{3}+1)}$$
$$f'(2) = \frac{3\times4}{2(8+1)}$$
M1

$$f'(2) = \frac{2}{3}$$
 A1

 $\frac{d}{dx}\left(\frac{x}{\sqrt{4x+9}}\right) = \frac{px+r}{\left(4x+9\right)^n} \quad \text{using the quotient rule}$

$$u = x, \quad v = \sqrt{4x+9} = (4x+9)^{\frac{1}{2}}$$

$$\frac{du}{dx} = 1 \quad \frac{dv}{dx} = 4 \times \frac{1}{2} \times (4x+9)^{-\frac{1}{2}} = \frac{2}{\sqrt{4x+9}}$$

$$\frac{d}{dx} \left(\frac{x}{\sqrt{4x+9}}\right) = \frac{\sqrt{4x+9} - \frac{2x}{\sqrt{4x+9}}}{4x+9}$$

$$= \frac{4x+9-2x}{\sqrt{4x+9}(4x+9)} = \frac{2x+9}{(4x+9)^{\frac{3}{2}}}, \quad p = 2, \quad q = 9, \quad n = \frac{3}{2}$$
A1

Question 2

a.
$$3^{x^{2}+6x} = \frac{1}{243} = 3^{-5}$$
$$x^{2}+6x=-5$$
$$x^{2}+6x+5=0$$
$$(x+5)(x+1)=0$$
$$x=-5, -1$$
A1

b. $\log_2(x^2 + 4\sqrt{2}) + \log_2(x^2 - 4\sqrt{2}) = 5$

$$\log_{2}\left(\left(x^{2}+4\sqrt{2}\right)\left(x^{2}-4\sqrt{2}\right)\right) = 5$$

$$\left(x^{2}+4\sqrt{2}\right)\left(x^{2}-4\sqrt{2}\right) = 2^{5}$$
M1
$$x^{4}-32 = 32$$

$$x^{4} = 64, \quad x^{2} = 8$$

$$x = \pm 2\sqrt{2}$$
A1

© Kilbaha Education This page must be counted in surveys by Copyright Agency Limited (CAL) http://copyright.com.au

(1)
$$2ax - 2by = 5 \implies 2by = 2ax - 5$$

(2) $(1-3b)x+12y = 2-4b \implies 12y = (3b-1)x+2-4b$
(1) $y = \frac{ax}{b} - \frac{5}{2b}$ (2) $y = \frac{(3b-1)x}{12} + \frac{1-2b}{6}$

for an infinite number of solutions the gradients and the y-intercepts are both equal, so

(3)
$$\frac{a}{b} = \frac{3b-1}{12}$$
 (4) $-\frac{5}{2b} = \frac{1-2b}{6}$ M1
(3) $a = \frac{b(3b-1)}{12}$ (4) $-30 = 2b(1-2b) = 2b-4b^2$
 $4b^2 - 2b - 30 = 0$
 $2b^2 - b - 15 - 0$ M1
 $(2b+5)(b-3) = 0$
 $b = 3$ $a = \frac{3(9-1)}{12} = 2$, or $b = -\frac{5}{2}$ $a = \frac{-\frac{5}{2}\left(-\frac{15}{2}-1\right)}{12} = -\frac{5}{2} \times \frac{-17}{2} \times \frac{1}{12} = \frac{85}{48}$

an infinite number of solutions when a = 2, b = 3 or $a = \frac{85}{48}, b = -\frac{5}{2}$ A1

Question 4

$$n = 6, \quad \hat{P} = \frac{X}{n} = \frac{X}{6} \qquad X \stackrel{d}{=} Bi(n = 6, p = ?)$$

$$\Pr\left(\hat{P} = \frac{1}{3}\right) = \Pr\left(X = 2\right) = \Pr\left(\hat{P} = \frac{1}{2}\right) = \Pr\left(X = 3\right)$$

$$\Pr\left(X = 2\right) = \binom{6}{2}p^{2}(1-p)^{4} = \Pr\left(X = 3\right) = \binom{6}{3}p^{3}(1-p)^{3}$$
A1

$$\frac{6\times 5}{2}p^{2}(1-p)^{4} - \frac{6\times 5\times 4}{3\times 2}p^{3}(1-p)^{3} = 0$$

$$5p^{2}(1-p)^{3}[3(1-p)-4p] = 5p^{2}(1-p)^{3}(3-7p) = 0$$
M1

since $0 , <math>p = \frac{3}{7}$, $X \stackrel{d}{=} Bi\left(n = 6, p = \frac{3}{7}\right)$

$$\Pr(\hat{P}=1) = \Pr(X=6) = \binom{6}{6} \left(\frac{3}{7}\right)^6 \left(\frac{4}{7}\right)^0 = \left(\frac{3}{7}\right)^6, \quad a=3, \ b=7, \ n=6$$

© Kilbaha Education This page must be counted in surveys by Copyright Agency Limited (CAL) http://copyright.com.au

$$f(x) = \begin{cases} \sqrt{5 - x^2}, & x \le 2\\ ax^2 + bx, & x > 2 \end{cases}, \quad \text{let } g(x) = ax^2 + bx$$

Since the function is continuous at x = 2,

$$f(2) = 1 = g(2) \implies (1) \quad 4a + 2b = 1$$
 A1

Since the join is smooth, the gradients are also equal.

$$f'(x) = \frac{d}{dx} \left(\sqrt{5 - x^2} \right) = \frac{-x}{\sqrt{5 - x^2}}$$

$$g'(x) = 2ax + b$$

$$f'(2) = -2 = g'(2) \implies (2) \quad 4a + b = -2$$

M1

(1)-(2)
$$b=3$$
, $4a=-5$, $a=-\frac{5}{4}$ A1

Question 6

$$y = f'(x) = 5\sin\left(\frac{x}{2}\right) + me^{-2x} + 4$$

at the origin the gradient is zero, f'(0) = 0

$$0 = 5\sin(0) + me^{0} + 4 = m + 4 = 0,$$

m = -4
A1

$$y = f(x) = \int \left(5\sin\left(\frac{x}{2}\right) - 4e^{-2x} + 4\right) dx$$

$$y = f(x) = -10\cos\left(\frac{x}{2}\right) + 2e^{-2x} + 4x + c$$

A1

$$f(0) = 0, \quad 0 = -10\cos(0) + 2e^{0} + c = -8 + c,$$

$$c = 8$$

$$y = f(x) = -10\cos\left(\frac{x}{2}\right) + 2e^{-2x} + 4x + 8$$

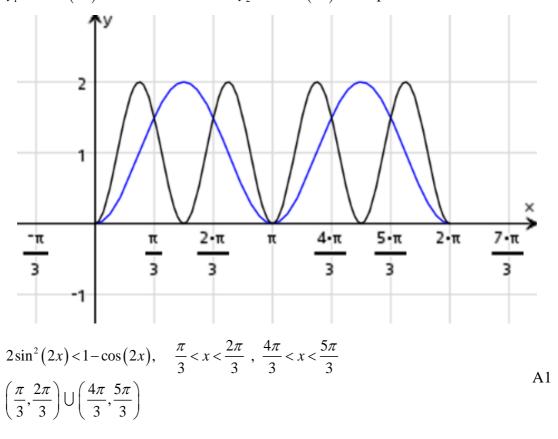

A1

© Kilbaha Education This page must be counted in surveys by Copyright Agency Limited (CAL) http://copyright.com.au

a.
$$2\sin^{2}(2x) + \cos(2x) - 1 = 0$$

 $2(1 - \cos^{2}(2x)) + \cos(2x) - 1 = 0$
 $2 - 2\cos^{2}(2x) + \cos(2x) - 1 = 0$
 $2\cos^{2}(2x) - \cos(2x) + 1 = 0$
 $2\cos^{2}(2x) - \cos(2x) - 1 = 0$
 $(2\cos(2x) + 1)(\cos(2x) - 1) = 0$
 $\cos(2x) = -\frac{1}{2}$, $\cos(2x) = 1$
 $2x = 2n\pi \pm \cos^{-1}(-\frac{1}{2})$, $2x = 2n\pi \pm \cos^{-1}(1)$
 $2x = 2n\pi \pm \frac{2\pi}{3}$, $2x = 2n\pi \pm 0$
 $x = \frac{\pi}{3}(3n \pm 1)$, $x = n\pi$ $n \in \mathbb{Z}$. A1

b. The two graphs intersect at $x = 0, \frac{\pi}{3}, \frac{2\pi}{3}, \pi, \frac{4\pi}{3}, \frac{5\pi}{3}, 2\pi$ from **a.** $y_1 = 2\sin^2(2x)$ $y_2 = 1 - \cos(2x)$ has a period of π

© Kilbaha Education This page must be counted in surveys by Copyright Agency Limited (CAL) http://copyright.com.au https://kilbaha.com.au

G2

a. completing the square

$$h(x) = 6 + 3x - x^{2} = -\left(x^{2} - 3x + \frac{9}{4}\right) + 6 + \frac{9}{4} = \frac{33}{4} - \left(x - \frac{3}{2}\right)^{2}$$

range $h = \left(-\infty, \frac{33}{4}\right]$
 $f(x) = \log_{e}(x - 2)$ domain $x - 2 > 0 \implies x > 2$, range R

| | f(x) | h(x) |
|--------|--------------|-------------------------------------|
| domain | $(2,\infty)$ | R |
| range | R | $\left(-\infty,\frac{33}{4}\right]$ |

Since range $h \not\subset$ domain f, so $f \circ h(x)$ does not exist.

b. solving
$$g(x) = 6 + 3x - x^2 = 2$$

$$\Rightarrow x^2 - 3x - 4 = 0$$

$$(x-4)(x+1) = 0$$

$$\Rightarrow x = -1, 4$$
M1

now g(-1) = g(4) = 2, $g\left(\frac{3}{2}\right) = \frac{33}{4}$, so if we now restrict the domain of g,

as
$$D = (-1, 4) = \text{domain } f \circ g(x) \text{ and the range of } g = \left(2, \frac{33}{4}\right]$$

so range $g \subseteq$ domain f, so now $f \circ g(x)$ exist.

$$f \circ g(x) = f(g(x)) = f(6+3x-x^2) = \log_e(6+3x-x^2-2)$$

$$f \circ g(x):(-1,4) \to R, \quad f \circ g(x) = \log_e(4+3x-x^2) = \log_e((4-x)(x+1))$$
 A1

© Kilbaha Education This page must be counted in surveys by Copyright Agency Limited (CAL) http://copyright.com.au https://kilbaha.com.au

A1

The two y values are equal at x = b so that (1) $\sin(b) = \sin(b - \alpha) + c$

$$y = \sin(x), \quad \frac{dy}{dx} = \cos(x) \text{ and } y = \sin(x-\alpha) + c, \quad \frac{dy}{dx} = \cos(x-\alpha)$$
The gradients are also equal at $x = b$ so that (2) $\cos(b) = \cos(b-\alpha)$ A1
square (1) $\sin^2(b) = \sin^2(b-\alpha) + 2c\sin(b-\alpha) + c^2$
square (2) $\cos^2(b) = \cos^2(b-\alpha) \text{ now add}$ M1
 $\sin^2(b) + \cos^2(b) = \sin^2(b-\alpha) + \cos^2(b-\alpha) + 2c\sin(b-\alpha) + c^2$
 $1 = 1 + 2c\sin(b-\alpha) + c^2$
 $2c\sin(b-\alpha) + c^2 = c(2\sin(b-\alpha) + c) = 0$
 $c = -2\sin(b-\alpha) = 2\sin(\alpha-b) \text{ since } c > 0 \text{ and } 0 < b < \alpha < \frac{\pi}{2}$ M1
from (1) $\sin(b) = \sin(b-\alpha) + c = \sin(b-\alpha) - 2\sin(b-\alpha)$
 $\sin(b) = -\sin(b-\alpha) = \sin(\alpha-b)$
 $b = \alpha - b$
 $2b = \alpha$
 $b = \frac{\alpha}{2}$
 $c = 2\sin\left(\alpha - \frac{\alpha}{2}\right)$
 $c = 2\sin\left(\frac{\alpha}{2}\right)$ A1

ii.

a.i.
$$f(x) = \begin{cases} \frac{a}{(2x+1)^2} & 1 \le x \le 4\\ 0 & \text{elsewhere} \end{cases}$$

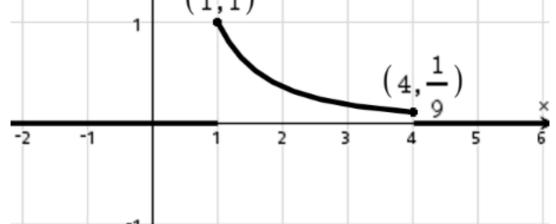

since it is a probability density function the total area under the curve is 1.

$$\int_{1}^{4} \frac{a}{(2x+1)^{2}} dx = 1$$

$$a \left[-\frac{1}{2(2x+1)} \right]_{1}^{4} = 1$$
A1
$$a \left(-\frac{1}{18} + \frac{1}{6} \right) = \frac{a(3-1)}{18} = 1$$
A1
$$a = 9$$

$$f(x) = \begin{cases} \frac{9}{(2x+1)^{2}} & 1 \le x \le 4 \\ 0 & \text{elsewhere} \end{cases}$$

$$f(1) = 1, \quad f(4) = \frac{1}{9} \quad \text{the graph is part of a truncus graph}$$
G1
$$(1, 1)$$

b.
$$g(y) = \begin{cases} \frac{b}{2y+1} & 1 \le y \le 4 \\ 0 & \text{elsewhere} \end{cases}$$

since it is a probability density function the total area under the curve is 1.

$$\begin{aligned} \int_{1}^{4} \frac{b}{2y+1} dy &= 1 \\ b \left[\frac{1}{2} \log_{e} (2y+1) \right]_{1}^{4} &= 1 \\ \frac{b}{2} \left(\log_{e} (9) - \log_{e} (3) \right) &= \frac{b}{2} \log_{e} (3) = 1 \\ b &= \frac{2}{\log_{e} (3)} \end{aligned}$$
A1
$$E(Y) &= \frac{2}{\log_{e} (3)} \int_{1}^{4} \frac{y}{2y+1} dy \\ E(Y) &= \frac{1}{\log_{e} (3)} \int_{1}^{4} \left(\frac{2y}{2y+1} \right) dy = \frac{1}{\log_{e} (3)} \int_{1}^{4} \left(\frac{2y+1-1}{2y+1} \right) dy$$
M1
$$E(Y) &= \frac{1}{\log_{e} (3)} \int_{1}^{4} \left(1 - \frac{1}{2y+1} \right) dy \\ &= \frac{1}{\log_{e} (3)} \left[y - \frac{1}{2} \log_{e} (2y+1) \right]_{1}^{4} \\ &= \frac{1}{\log_{e} (3)} \left[4 - \frac{1}{2} \log_{e} (9) - 1 + \frac{1}{2} \log_{e} (3) \right] = \frac{1}{\log_{e} (3)} \left(3 - \frac{1}{2} \log_{e} (3) \right)$$
A1
$$&= \frac{3}{\log_{e} (3)} - \frac{1}{2}, \quad p = 3, \quad q = -\frac{1}{2} \end{aligned}$$
